

Neighbourhood matters!

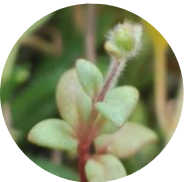

Plant survival and fitness is favoured in experimentally manipulated communities with high phylogenetic diversity

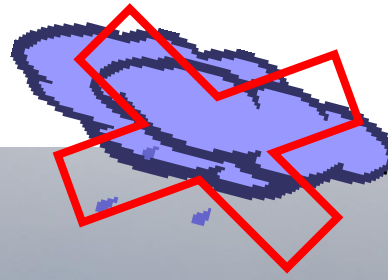

Chaves, R., Ferrandis, P., Ortiz, M. L., Escudero, A. & Luzuriaga, A.L.

Introduction

Gypsum soils

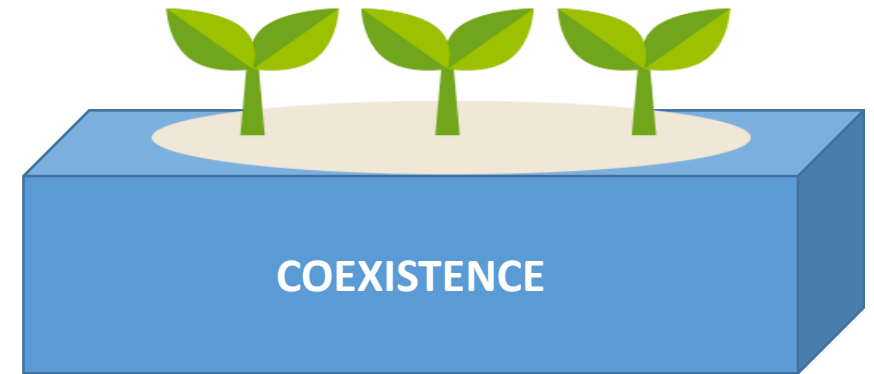

Community
assembly

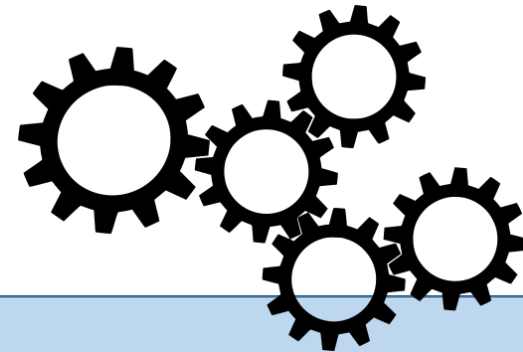

> 100 spp!

In 20 cm² 15 - 25
different species!

How can
they coexist?

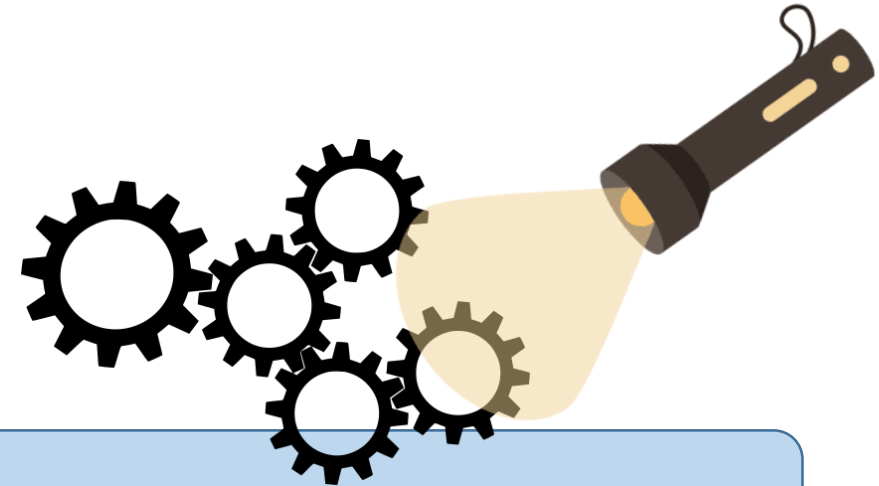

Mechanisms are not well-known yet

In 20 cm² 15 - 25
different species!

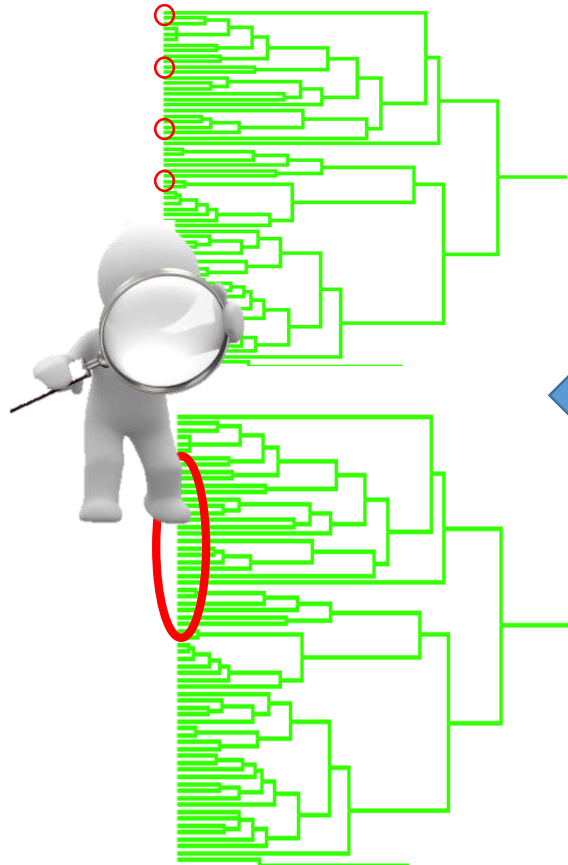

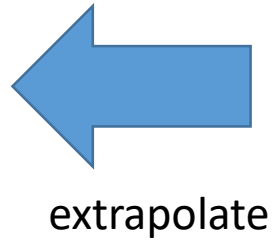

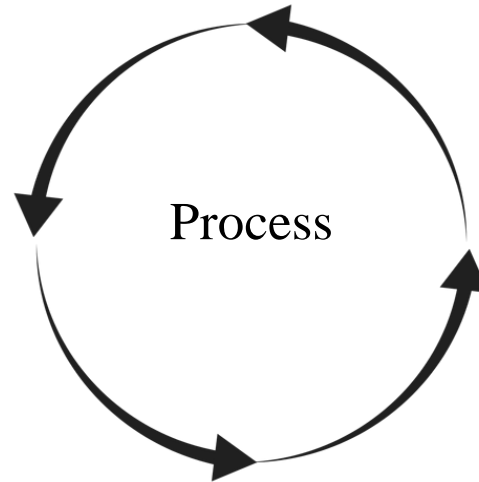

How can
they coexist?

Mechanisms are not well-known yet

Phylogenetic diversity

Previous studies:

It is an interesting approach because it reflects:

- The evolutionary history of competing species
- Their ecological capabilities (at least in part)

Phylogenetic diversity

Previous studies:

extrapolate

Process

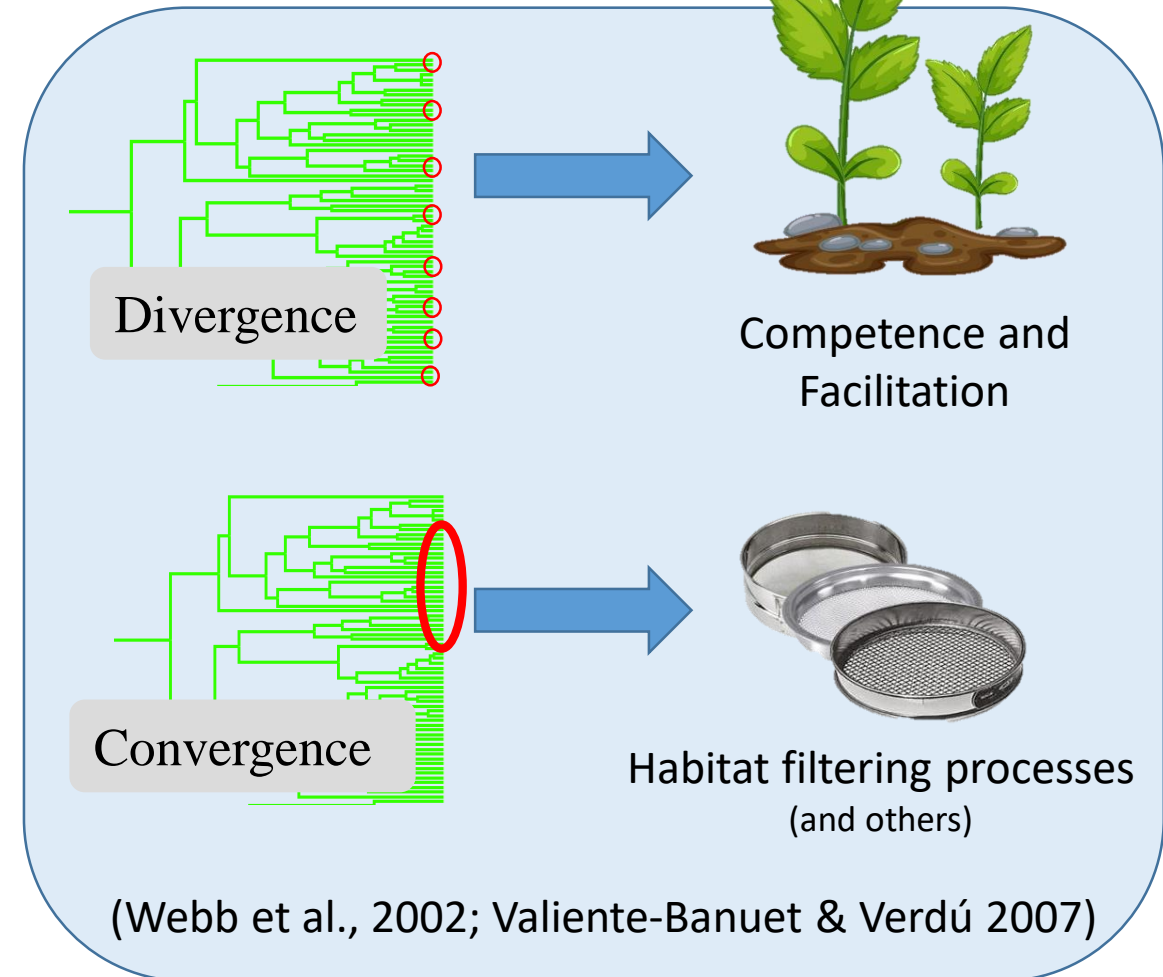

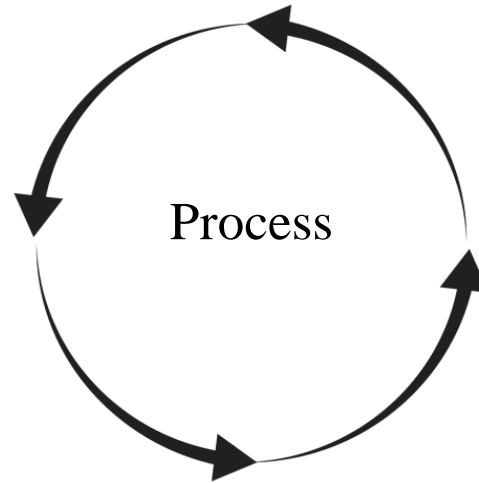

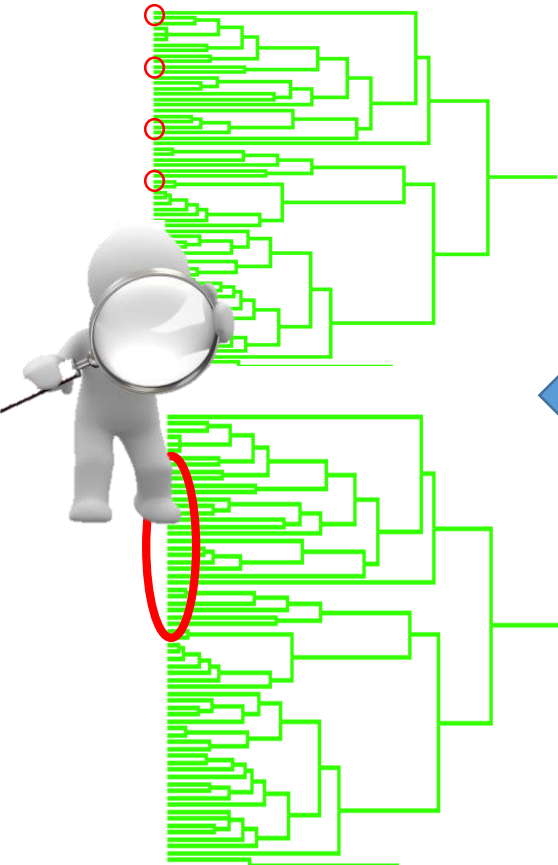

Divergence

Convergence

Competence and Facilitation

Habitat filtering processes
(and others)

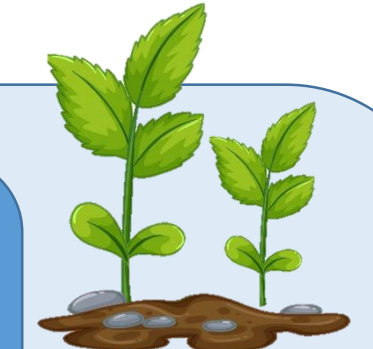

(Webb et al., 2002; Valiente-Banuet & Verdú 2007)

Phylogenetic diversity

Previous studies:

What is about cause-effect relationships?

What is about cause-effect relationships?

Phylogenetic diversity

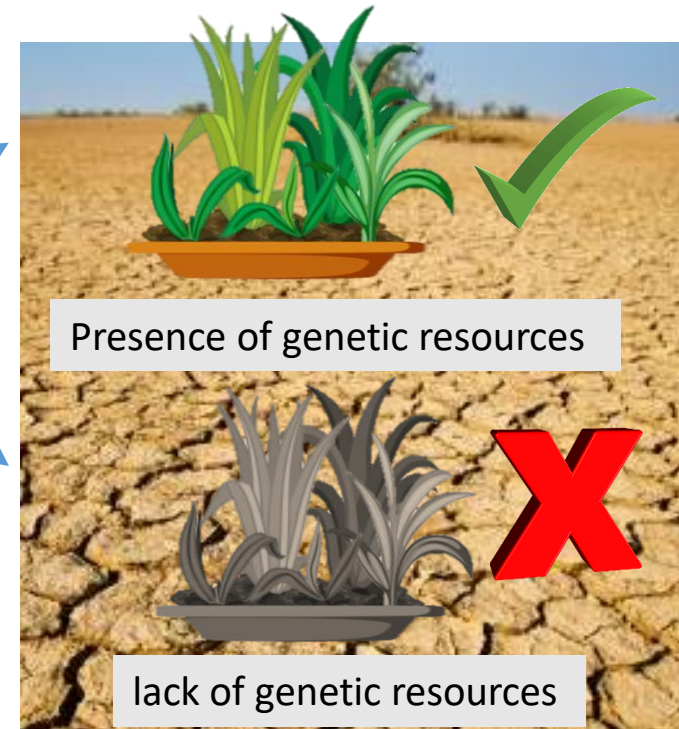

- Promote plant productivity and ecosystem stability
- Less prone to compete for the same resources
- Can benefit from facilitative interactions.
- Niche complementarity

- if there is a conservative trend of functional traits...

Multiple strategies

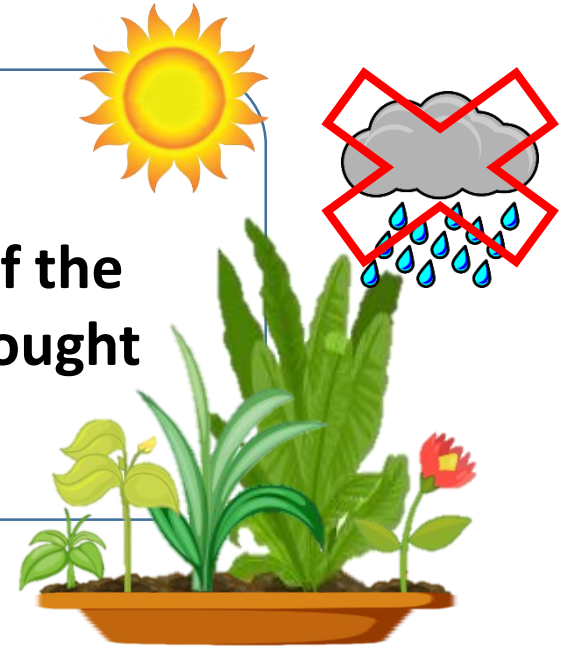

Presence of genetic resources

lack of genetic resources

Question

We wanted to evaluate if the phylogenetic structure of the plant community determine individual response to drought

Question

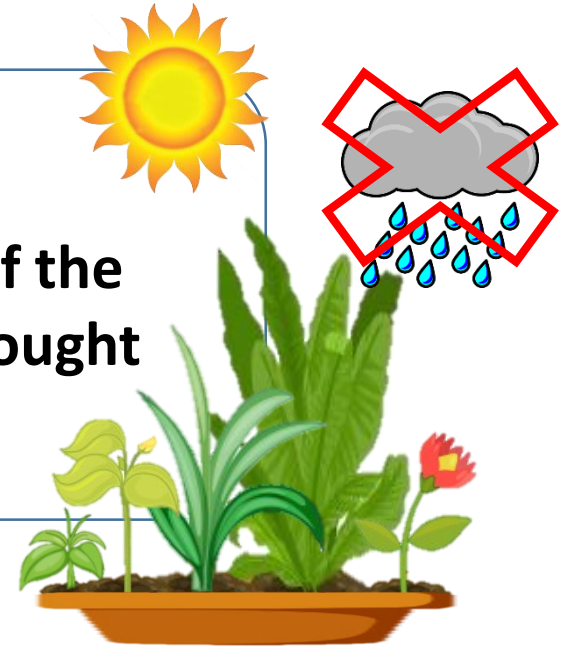

We wanted to evaluate if the phylogenetic structure of the plant community determine individual response to drought

Survival

**Common
garden**

Question

We wanted to evaluate if the phylogenetic structure of the plant community determine individual response to drought

Survival

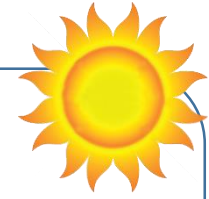

Fitness

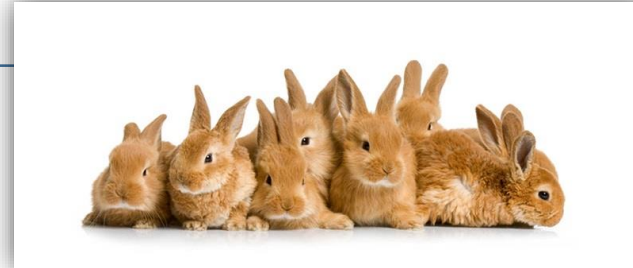

Question

We wanted to evaluate if the phylogenetic structure of the plant community determine individual response to drought

Survival

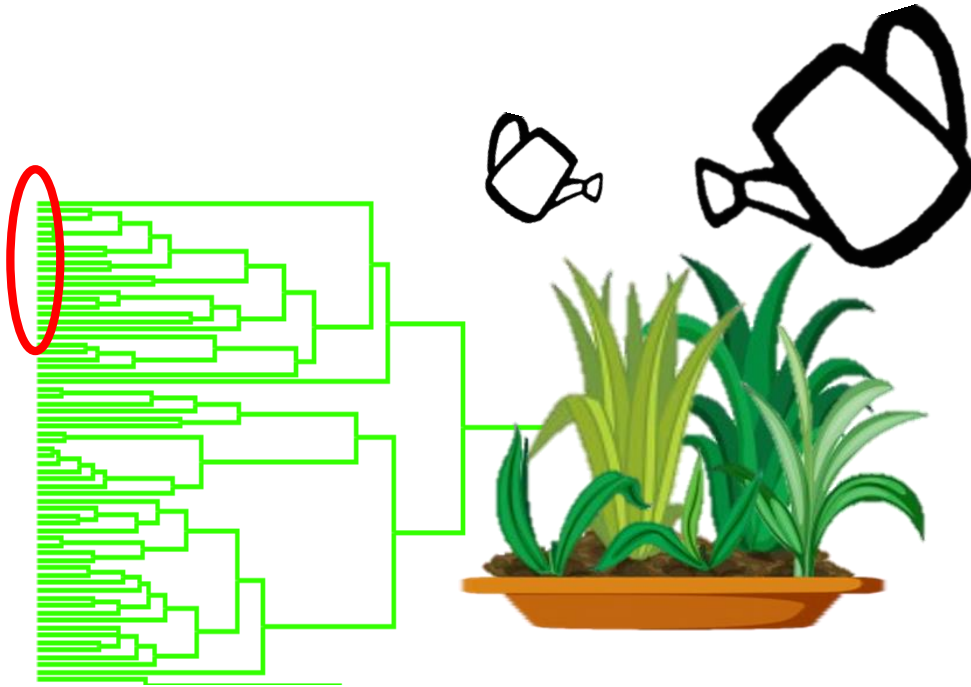

Fitness

Experimentally manipulate the phylogenetic diversity of each specific assembly

Materials and methods

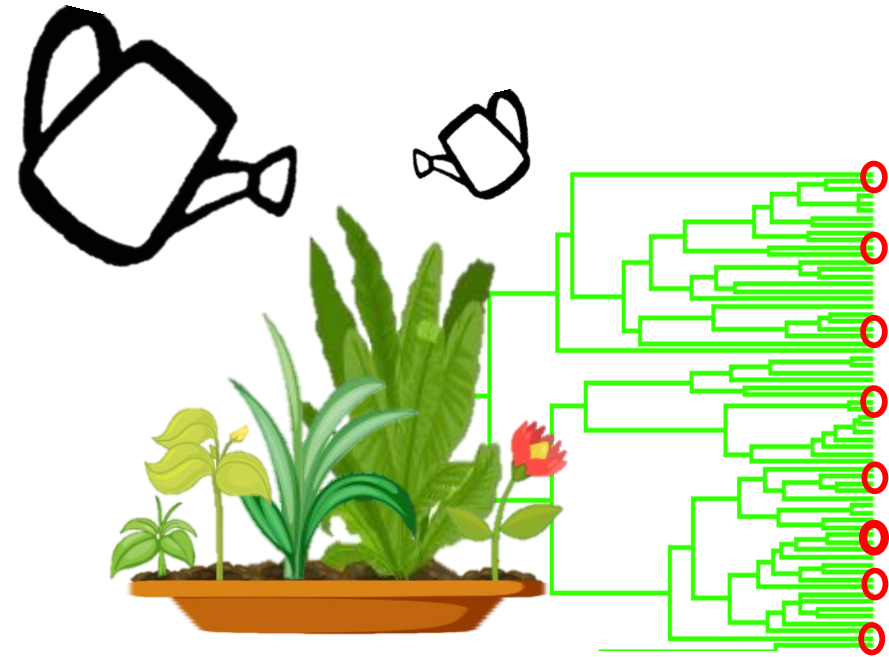

Low phylogenetic diversity

(PSV = 0.3)

Two combinations of species

Seven species per plot

Ten plants per species (70 plants per plot)

High phylogenetic diversity

(PSV = 0.8)

Two combinations of species

Seven species per plot

Ten plants per species (70 plants per plot)

Monitoring

High
phylogenetic
diversity

Control

Drought

Low
phylogenetic
diversity

Control
